

Voice2Baby

Guide for Clinical Staff

Using the website: rooms, babies, families, recordings, and speakers

For nurses and doctors

1 What Voice2Baby is (and your part in it)

Voice2Baby lets a parent record their voice from anywhere. That recording is reviewed by clinical staff and then played on a small speaker at their baby's incubator on a schedule or on demand.

There are three kinds of user:

- **Parent:** records and submits voice messages for their baby (they only see their own baby).
- **Nurse:** reviews each recording, then schedules it or plays it.
- **Administrator:** sets up rooms, babies, families, and speakers, and manages nurse and parent accounts. Full oversight.

This guide covers the **nurse** and **administrator** tasks.

2 Getting started

2.1 Signing in

Open voice2baby.com and sign in with your email and password. You'll land on the view for your role. Accounts are created *by invitation*: an administrator adds you, and you receive an email with a link to set your own password.

2.2 Forgot your password

On the sign-in page, click **Forgot your password?**, enter your email, and you'll receive a link to choose a new one. The link expires after one hour.

Note on email: invitations and reset links are sent by email. If a message doesn't arrive, check spam, and confirm the address was typed correctly when the account was created.

3 Administrator tasks

Administrators have five areas, shown as tabs: **Babies**, **Rooms**, **Speakers**, **Nurses**, and **Parents**.

3.1 Rooms

The **Rooms** tab manages NICU rooms and their capacity.

- **Add room:** give it a room number and a capacity (how many babies it holds).
- **Edit:** change the number or capacity.

- **Deactivate / Reactivate:** take a room out of use without deleting it.
- **Delete:** only possible when the room is empty (no babies assigned).

3.2 Babies

The **Babies** tab manages babies, rooms, and admissions.

- **Add baby:** enter the baby's details and assign a room.
- **Edit:** update details.
- **Discharge:** mark a baby as discharged when they leave. **Readmit** brings them back.
- **Reassign room:** move a baby to a different room.
- **Recordings:** open a baby's messages to see and manage them.
- **Delete:** permanently remove a baby and their history (used rarely).

3.3 Families (Parents)

The **Parents** tab shows families and which baby each parent is linked to.

- **Add parent:** create a parent account and link them to a baby as *primary* or *secondary*. They receive an email invitation to set their password.
- A parent can be linked to more than one baby, and a baby can have more than one parent (but up to two guardians).
- **Resend invite:** if they didn't get / lost the invitation email.
- **Edit:** link another baby, or unlink one (a parent always keeps at least one baby).
- **Delete:** permanently remove the parent.

3.4 Nurses

The **Nurses** tab manages nurse accounts.

- **Add nurse:** create the account; they get an email invitation.
- **Resend invite / Delete** as needed. Pending (not-yet-activated) accounts are marked **Invite pending**.

3.5 Speakers

The **Speakers** tab is where you monitor the room speakers and assign them to babies.

- Each speaker shows as **Online** or offline, and which baby it's assigned to.
- **Assign**: link a speaker to the baby whose recordings should play on it. **Unassign** to free it.
- **Add a speaker** / **Delete**: register or remove a device. (New speakers usually register themselves automatically — see Section 6.)

A recording can only play in a room once its baby's speaker is **Assigned** and **Online**. If playback isn't working, check this tab first.

4 Nurse tasks

4.1 Finding a baby's messages

From the nurse view, choose a **Room** to see its babies and their messages, or open a baby's **Recordings** directly. Each message shows its parent, length, and current status.

4.2 Reviewing a new recording

New recordings arrive with the status **Pending review**. For each one you can:

- **Listen**: preview the audio before deciding.
- **Schedule**: approve it and choose *when* it should play (pick a date and time). It then shows **Scheduled**.
- **Decline**: reject it, with a short message to the parent explaining why (e.g. audio too quiet). It then shows **Rejected**.

4.3 Playing, stopping, and rescheduling

For an approved (scheduled) recording:

- It plays **automatically** at its scheduled time on the baby's assigned speaker.
- **Play**: play it *now* instead of waiting. While it's playing you'll see **Playing now** / **On the speaker now**.
- **Stop**: stop playback immediately.
- You can reschedule or **Cancel** a scheduled message before it plays.

Once it has played, it shows **Played**.

4.4 What the statuses mean

- **Pending review:** newly submitted; waiting for a nurse.
- **Scheduled:** approved and set to play at a chosen time.
- **Playing now:** currently on the speaker.
- **Played:** has already played to the baby.
- **Rejected:** declined (the parent was told why); they may submit a new one.

5 How a parent uses it (so you know the flow)

A parent signs in, opens their baby, and **records** a message in the browser (or uploads one), then submits it. It arrives in your queue as **Pending review**. After you schedule it and it plays, the parent is notified that their baby heard their voice. You don't manage parent recording — this is just so you understand where new messages come from.

6 Setting up and using a speaker

The speaker is a small device (a Raspberry Pi) in the baby's room that plays the audio. From the website it's simply something you **Assign** to a baby on the **Speakers** tab, and it shows **Online** when it's powered on and connected. You set a speaker up *once*; after that you never touch it. No technical experience needed — about 10 minutes.

6.1 What you'll need

- The **Raspberry Pi** + power adapter, a **microSD card** (8GB+), and a **small speaker** that plugs into the Pi.
- Any **computer** with a memory-card slot (or a USB card reader).
- Your **Wi-Fi details**: for normal Wi-Fi, the network name + password; for **university/enterprise** (eduroam-style), the name + a **username and password** (ideally a device/service account from IT, not a personal login) and, if IT provides them, the network's **certificate** file and its **domain**.

6.2 Prepare the card

1. Install **Raspberry Pi Imager** from [raspberrypi.com/software](https://www.raspberrypi.com/software).
2. **Choose OS** → **Use custom** → the Voice2Baby image: [*download link goes here*].
3. **Choose Storage** → the memory card.

Careful: pick the memory card, not another drive — this erases it.

4. **Write.** If asked about *OS customisation*, click **No**.
5. Re-insert the card; a drive named **bootfs** appears. Open **wifi.txt** and fill in **one** of the three options (only change the values after each =):

A) Normal Wi-Fi:

```
security=wpa-psk
ssid=NICU-Staff-WiFi
password=mypassword123
```

B) University / enterprise (eduroam):

```
security=wpa-eap
ssid=eduroam
identity=deviceaccount@university.edu
password=the-account-password
```

C) Open Wi-Fi:

```
security=open
ssid=Guest-WiFi
```

Save the file and eject the card.

6.3 Start it

Put the card in the Pi, plug in the speaker, and connect power. **Wait about 10 minutes** on the first start; it sets itself up, restarts once on its own, and connects. No screen or keyboard needed.

6.4 Assign it

On the website's **Speakers** tab, the new speaker (e.g. PI-00042) appears **Online**. Click **Assign** and choose the baby. That's it.

Change Wi-Fi later: pull the card, edit **wifi.txt** on any computer, and slide it back in — no re-flashing.
